

The **Deka CO2 laser** is a powerful skin resurfacing treatment that uses fractional laser technology to address a wide range of skin concerns, including wrinkles, fine lines, acne scars, pigmentation, and skin texture irregularities. By creating controlled micro-injuries in the skin, it stimulates the body's natural healing process, promoting collagen production and revealing smoother, firmer, and more youthful-looking skin.

Pre-Treatment:

- **Consultation:** A thorough consultation is conducted to determine the suitability of the Deka CO2 treatment for your skin concerns.
- **Skin Preparation:** A skincare regimen may be recommended in the weeks leading up to the procedure to enhance the skin's readiness.
- **Avoid Sun Exposure:** It is advised to avoid direct sun exposure and to use a broad-spectrum sunscreen.
- **Topical Anesthesia:** On the day of the procedure, a topical numbing cream is applied to minimize discomfort during treatment.

Post-Treatment:

- **Redness and Swelling:** Immediately after the procedure, redness and swelling are common and may last for several days.
- **Skin Shedding:** You may experience peeling or flaking as the skin heals and regenerates.
- **Moisturization:** Keeping the skin well-hydrated with recommended products is crucial for optimal healing. NO AQUAPHOR ALLOWED TO USE
- **Sun Protection:** Avoiding sun exposure and applying sunscreen is essential to protect the skin from hyperpigmentation during the healing process.
- **Results:** Visible improvements, such as smoother skin and reduced wrinkles, will begin to show after the skin heals, typically in 1-2 weeks, with full results developing over the following months as collagen continues to rebuild.

The Deka CO2 laser is an effective treatment for those seeking long-term skin rejuvenation with significant improvements in skin tone, texture, and overall appearance.
